

Questions from PNR Live 9th February 2018

Q: Are you using a rotary steerable system for the horizontal section?

A: We are not currently using a rotary steerable system, but may do in the future. We are currently using a downhole motor and what is known as a “bent housing” motor to build angle for the horizontal drilling at Preston New Road.

Q: Will it be possible to drill multiple horizontal wells at different depths from a single pad, so as to reduce the need for more pads in the area?

A: Yes. Horizontal drilling enables multiple subsurface wells to be drilled from one well pad which significantly reduces the visual impact on the surface and the environmental footprint.

Q: Do you plan to drill any laterals towards the AFC Fylde stadium either at PNR or any other site?

A: Our current planning permission for Preston New Road only allows wells to be drilled to the west of the site in the direction of Blackpool. Future planning applications may of course lead to wells being drilled in a different direction.
